Non-Destructive Inspection

Non-destructive inspection is used to detect geometrical faults, e.g., material thickness, welding defects, bondline defects, delamination, wrinkles, porosity, dry areas, foreign objects, cracks, or corrosion.

This ensures their products integrity and reliability while in-service, which allows them to save both time and money when evaluating their products.

We offer the full range of inspections and blade testing services:

- Tap testing
- X-ray inspection
- Leak testing
- Penetrant inspection
- Eddy current inspection
- Magnetic particle inspection
